

for three more days.

In low voltage injuries pulmonary oedema is the most life threatening complication in animals that survive the shock. Early aggressive removal of all devitalized tissues is the most important aspect of treatment (Remensnyder, 1990). Second intention healing of the lip injuries particularly those involving the commissure can limit opening of the mouth (Harvey, 1993). Topical antimicrobial agents are applied to control burn wound sepsis until debridement. Mefanide is the agent of choice because of its ability to penetrate deeply (Pope, 1985).

Plus web supplement of 1 page

Anthracosis is the deposition of carbon or coal dust in the lungs. It is so frequent in city-reared animals especially in dogs, horses and mules used in and around coal mines (Runnells, 1960; Jubb & Kennedy, 1985; Jones & Hunt, 1983). The lungs and its lymph nodes are reservoirs for various dust particles; the dust is also found free in the bronchioles and alveoli, in macrophages in the alveoli and medulla of lymph nodes. Anthracosis condition has been reported in different domestic animals; few reports are available on wild animals. Hence the present communication records the occurrence of pulmonary anthracosis in lions and leopard of both sexes living at S.V. Zoo Park, Tirupati during the year 2005. However, these animals were brought from Kerala Circus.

Carcasses of lions (5) and leopard (1) of both sexes were aged about 16-25 years. On necropsy, examination of the lungs revealed generalized uniform distribution of minute dark spots on the sub pleural surface of lungs (Image 1^w). Represented lung pieces were collected in 10% formalin and processed by routine conventional methods.

Histological studies of lung tissue revealed the deposition of minute black granules in clumps in alveolar walls and macrophages in inter alveolar connective tissue septa. The macrophages laden with carbon particles were also seen in the peribronchiolar area. The minute black particles proved negative for haemosiderin and melanin pigment on special staining. The gross and microscopic observations recorded in this observation are similar to Farrow (1975) and Gupta (1991).

The chances of felines at S.V. Zoo Park, getting exposed to coal particulars are remote since the zoo area is relatively free from such

pollution. However, since these lions and leopards in the S.V. Zoo Park were brought from Kerala Circus, the possible justification of anthracosis in these animals could be due to the movement of circus animals to many industrial cities and inhalation of coal particles might have resulted in anthracosis.

NATIONAL CONFERENCE ON BIORESOURCES CONSERVATION AND MANAGEMENT

November 21 & 22, 2007

Basic to life is Biodiversity

Theme: Bioresources for sustainable use We all know that biodiversity is the wealth of the Earth and is the basis for different cultures, life styles and developmental activities. We began to think that biodiversity can be manipulated with the science and technology to perpetuate life and advances in human life styles. But, it is not correct to think this way because technology does not work if the resources do not exist in their wild form. It is important to realize that diversity in bioresources at genetic, species and ecosystems level is imperative for sustainable development. The biodiversity is a collective form of numerous complex interactions over a long period of time and no life form can live on its own in isolation. But, there is hardly any knowledge about the functional biology of bioresources, especially from India for providing effective conservation to species. It is in this context, this National Conference is proposed to provide a platform for all those concerned to have deliberations on various themes in order to frame effective strategies for the conservation and management of bioresources, and also advance our researches on the themes of this conference.

I look forward to welcoming you to Visakhapatnam for this National Conference in November 2007.

Major themes to be covered:

1. Terrestrial and Wetland biodiversity;
2. Apiculture and Silviculture;
3. Plant Reproductive Biology;
4. Biodiversity – Biotechnology & Biodiesel Production;
5. Bioresources and ecotourism;
6. Pollution versus Biodiversity;
7. Forest resources for sustainable use;
8. Biodiversity assessment and conservation using Remote Sensing and GIS;
9. Biodiversity Conservation
